

We worked with the advantages of an aged population and based our agro-touristic proposal to the Mom's cooking, Daddy's stories and Gramma's garden and traditions and took advantage of the touristic potential of Ocna Muresului.

The future city will allow tourists to experiment what it would be like to inhabit in a sustainable city, aiming to transform the cities we live in for the next generations and by showcasing elements of a smart city and the way they work together, we'll educate general public in the area.

Introducing renewable energy, active housing and smart grid, land and urban farming, helping population with designing energy efficient and healthy homes, activities in order to create a stable income, create new jobs around for sustainable evolution are just a part of our proposal. Our social aim is to give the young generation a reason to stay and a reason for elderly population to live and help others understand climate change as they lived other climatic challenges.
